MEDMULS

Emulsifying compounds and solubilizers.

- **Medmuls B200:** is a selected blend of Cetearyl Alcohol and Peg 20 Stearate and is a general purpose non-ionic self emulsifying wax for oil-in-water cosmetic and pharmaceutical emulsions.
- **Medmuls COH 40:** is ethoxylated hydrogenated castor oil and is a non-ionic solubilizer for essential oils and hydrophobic substances in aqueous and hydro-alcoholic solutions. It is also an excellent emulsifier.

- **Medmuls GMS AS:** is a selected blend of Glyceryl Monostearate and Peg 100 Stearate and is a suitable non-ionic emulsifier for creams and lotions containing large amounts of non-polar oils and waxes. It is also stable at acidic pH.

- **Medmuls LE:** provides an emulsifying system for hair dyes in cream. Hair dyes produced by Medmuls LE are particularly stable in time, easy to produce and maintain unchanged the viscosity in time. Medmuls LE allows the achievement of particularly omogeneous

full "nuances". Shaeds of nuances are perfect, with evident scalar of colour strength, as opposed to many dyes produced by traditional ingredients that, often, cannot graduate the development of active oxygen active during setting.

- **Medmuls MX:** is an excellent base for depilatory creams. Medmuls MX allows a easy formulation of high performance O/W creams, stabilized in a highly alkaline environment, with a high or a low amount of fatty phase, with a pleasant appearance and good spreading characteristics. The concentration of use ranges from 5% to 10%, depending on the quantity and characteristics of the ingredients of the formulation. Emulsions prepared by Medmuls MX acquire their final viscosity after some 12 hours from production and show excellent organoleptic properties and thermal resistance, perfect stability of pH and assay of thioglycolate. Values that guarantee a safe and efficient use of the depilatory cream for long time.
